

SIP trunks are the new standard for enterprise **voice communications**.

Carrier-grade voice networks have been using digital voice services for over 45 years, and now you too can use this open IP standard to connect all of your locations. With SIP trunks, you combine your voice, internet, and WAN traffic all over a single IP connection. You'll see immediate service cost reductions, increased productivity, and boosted network capacity.

The flexibility of iTel's SIP trunking service is ideal for companies of all sizes. From managed ADSL to a multi-site enterprise linked by MPLS, services can be utilized with your existing IP-PBX or combined with an optional iTel cloud PBX for a completely integrated solution.

REAL BENEFITS

Reduce Costs

You'll see an immediate service cost reduction when you move to SIP trunking, and eliminate the need for separate voice and data circuits.

Share Your Resources

SIP trunking lets you share your entire channel capacity seamlessly across all of your locations. Take advantage of peak time differences to reduce your overall line requirements.

Burstable Capacity

iTel SIP trunking lets you buy channels for your average use, instead of peak usage. We can instantly burst your capacity to meet increased demand, so your lines will never ring busy.

Number Mobility

The numbers we assign to your SIP trunks are not limited by location. Have numbers from across the country ring to a central location, and use a pool of numbers to track the effectiveness of marketing efforts.
